Colors and Methods i...

Instruction

In this practice session, we are going to practice using different ways of defining colors in HTML.

1. We've already done a bit of a setup for you by adding some scaffolding code for you. You can start working directly inside the body element.
2. Add a div tag. Use the style attribute and define a height and a background as shown below.

```
<div style="height:200px; background-color: orange;"></div>
```

3. Next, create another div after the first div, keep the height same but use the hex code to define the color as shown below.

```
<div style="height:200px; background-color: #d45079;"></div>
```

4. Create another div, define the same style attribute with the height and color but this time, use the rgb method to specify the color as shown below.

```
<div style="height:200px; background-color: rgb(50,62,221);"></div>
```

5. Finally, create the last div. Use the style attribute to specify the color and height. Use the hsl method specify the color as shown below.

```
<div style="height:200px; background-color: hsl(204.2, 64.7%, 46.7%);"></div>
```

6. Your final code should look like this.

```
<body>
  <div style="height:200px; background-color: orange">
</div>

  <div style="height:200px; background-color: #d45079">
</div>

  <div style="height:200px; background-color:
rgb(50,62,221)"></div>

  <div style="height:200px; background-color: hsl(204.2,
64.7%, 46.7%);"></div>
</body>
```
